## 1-Phase, Zero Cross or Instant On Switching

### 25 AAC, 230 VAC with LED and Built-in Transil

#### Types RF1A, RF1B

- AC switching Solid State Relay
- Switching through back to back thyristors
- Long lifetime through reduced stress on output chip
- Operational ratings: up to 280 VAC, 25 AAC
- Control voltage: 5 VDC, 12 VDC, 24 VDC
- LED for control status indication
- Integrated overvoltage protection on output
- Opto isolation input to output 3750 VAC
- 100k cycles endurance test according to UL508
- Pre-attached thermal interface to SSR backplate

## Product Description

The RF1 series provides a compact solid state switching solution suited for confined spaces. Long life time is ensured by the use of assembly technology that reduces stresses on the power semiconductors.

The RF1 series is suitable for resistive loads. The zero switching type (RF1A), switches ON when the voltage crosses zero. The instant-ON type

(RF1B), switches on when the control voltage is applied. Switch OFF occurs when current crosses zero.

Integrated transils provide protection against overvoltages. A green LED indicates presence of the control voltage. FASTON terminals enable fast installation. The RF1 is provided with pre-attached thermal interface ready for mounting on chassis or heatsink.

Specifications are stated at 25°C unless otherwise noted

Note:

- Performance Criteria 1: No degradation of performance or loss of function is allowed when the product is operated as intended.
- Performance Criteria 2: During the test, degradation of performance or partial loss of function is allowed. However when the test is complete the product should return operating as intended by itself.
- Performance Criteria 3: Temporary loss of function is allowed, provided the function can be restored by manual operation of the controls.
- Control input lines must be installed together to maintain products' susceptibility to Radio Frequency interference.
- Use of AC solid state relays may, according to the application and the load current, cause conducted radio interferences. Use of mains filters may be necessary for cases where the user must meet E.M.C requirements. The capacitor values given inside the filtering specification tables should be taken only as indications, the filter attenuation will depend on the final application.
